Jayden Lee

jeyl@berkeley.edu | (509) 316-6808 | linkedin.com/in/jaydenelee | github.com/jynlee7

Education

University of California, Berkeley, Berkeley, CA **May 2028**
Bachelor of Arts in Data Science, Domain Emphasis: Applied Mathematics GPA: 3.7/4.0
Relevant Coursework: Data Structures and Algorithms, Data Engineering, Multivariable Calculus, Linear Algebra
Activities: Sports Analytics Group at Berkeley, Cal eSports D2 League Coach

Technical Skills

Languages: Python, SQL, R, Java, C++, JavaScript, TypeScript, HTML/CSS
Data/ML: Pandas, Polars, NumPy, scikit-learn, PyTorch, TensorFlow, Matplotlib, seaborn, PostgreSQL, Parquet, ETL/ELT
Tools: Snowflake, Supabase, Docker, Git, Slurm, Tableau, Jupyter/Colab Notebooks, Excel, Claude Code, Codex, Jira, conda
SWE: React, Vite, REST APIs, Playwright, Automated Testing, Git Worktrees
Practical Interests: Sports, eSports, Philosophy, Traveling, Metals and Jewelry

Experience

SwingVision, *Berkeley, CA, Data Analyst Intern* **September 2026 - Present**
- Collaborating with ML engineers to develop labeling workflow, improving annotation consistency by 50% across 50+ hours of sports data.

CalCompute, *Berkeley, CA, AI Engineering Intern* **May 2026 - September 2026**
- Built an agentic “Second Brain” knowledge pipeline that transformed raw research into structured, source-grounded notes for LLM retrieval and reasoning workflows; 22 sources and 173 references
- Optimized LLM context with 2.9x reduction, cutting prompt size 72.5%, inference cost 65.3%, and mean latency 33.5% across a 14-query evaluation

MatX (Contract), *Berkeley, CA, AI Software Engineer* **January 2026 - May 2026**
- Engineered a Kubernetes LLM benchmarking platform that put model submissions into standardized Docker runners, enabling reproducible evaluation without rebuilding container images for each submission
- Automated the end-to-end submission, metric collection, and leaderboard pipeline for LLM inference benchmarks

Cal Athletics (Contract), *Berkeley, CA, Data & AI Engineer* **February 2026 - May 2026**
- Cleaned and unified 3M+ ticket records across 200+ attributes into a Snowflake and Colab pipeline that fed the fan engagement model used across Cal's 30+ varsity sports
- Predicted ticket purchase propensity from behavioral data with clustering and supervised ML models, producing a dynamic fan scoring system

Pacific Northwest National Laboratory, *Richland, WA, Data Science Intern* **June 2024 - May 2025**
- Streamlined cross-model AI benchmarking by building automated Python and Parquet ETL pipelines that unify 3 data schemas across 300k+ mass spectra datasets
- Accelerated inference across 300k files by scaling GPU batch workflows on a Slurm HPC cluster, and engineered target-decoy statistical frameworks to model False Discovery Rates (FDR)

Projects

bearings, *React, TypeScript, PostgreSQL, Playwright, Jira, MCP, Codex*
- Built a full-stack Berkeley exploration platform with authenticated check-ins, XP progression, and organization leaderboards, backed by PostgreSQL for persistent user, location, and progression data
- Engineered an agentic SWE workflow connecting Jira tasks to agents through MCP, automating portions of sprint tasks
- Built a multi-harness quality gate spanning TypeScript compilation, component tests, accessibility checks, browser interactions, visual screenshots, and change-boundary validation before integrating AI-generated code

Foresight: Clinical Intervention Simulator, *Python, scikit-learn, Numpy, Tableau*
- Placed #1 out of 50 UC Berkeley teams by developing a clinical intervention simulation and decision-support system.
- Trained a Random Forest model to estimate changes in patient risk over time and dynamically compare intervention strategies for high-risk patients.

Personal Website, *TypeScript, Vite, Git, Claude Code, CI/CD*
jaydenelee.com
- Maintained a 7K+ line TypeScript codebase across dozens of AI-agent development sessions using machine-readable specifications, automated quality gates, and structured release logs
- Parallelized development by routing design, implementation, and code-review tasks to specialized agents operating in isolated Git worktrees, preventing merge conflicts across concurrent workflows
